The pioneers of early surgical intervention to correct congenital cardiac anomalies - the multidisciplinary team at the largest paediatric hospital in the USA - share the advanced techniques and protocols they have developed and refined over the past two decades. These techniques reduce the high mortality rate associated with congenital anomalies during the first year of life. And they prevent the irreversible secondary organ damage caused when surgery is deferred until later in childhood ...

Fever in the neonate after cardiac surgery should prompt consideration of infective endocarditis (IE). A new murmur, confirmed by patient history or review of postoperative records when available, may occur secondary to dehiscence of a patch of conduit or turbulent flow from the presence of a vegetation. Other clinical manifestations of IE in a neonate are variable and nonspecific and include poor feeding, tachycardia, and signs of sepsis. Embolic phenomena are common, resulting ...

The premature neonate with congenital heart disease (CHD) represents a challenging population for clinicians and researchers. The interaction between prematurity and CHD is poorly understood; epidemiologic study suggests that premature newborns are more likely to have CHD and that fetuses with CHD are more likely to be born premature. Understanding the key physiologic features of this special patient population is paramount. Clinicians have debated optimal timing for referral for cardiac ...

Neonatal surgery - UHS

In congenital cardiac surgery, commonly used outcomes include mortality, duration of mechanical ventilation, intensive care unit (ICU) stay, and hospital stay. 6,7 In the neonatal population, these outcomes often can be problematic because mortality is infrequent, and the other outcomes often have a wide range or large standard deviation resulting in inadequately powered studies or the need ...

The researchers examined 58 six-year-old cardiac surgery survivors at Edmonton's Stollery Children's Hospital and the Montreal Children's Hospital. Seventeen per cent of the children were found to have chronic kidney disease, compared with two per cent of the general pediatric population in Canada. Thirty per cent of the survivors had high blood pressure, compared with less than one per ...

o Infants and children following cardiac surgery often have less compliant ventricles so optimal preload is easily exceeded. Cardiac surgery in the neonate has become an important and accepted treatment for many forms of structural heart disease. Although a detailed discussion of cardiac surgery is beyond the scope of this chapter, an overview is helpful for all practitioners who care for neonates, both to help participate in their care and to aid in counseling families. This chapter will be subdivided into 2 parts ...
