Compare NaOH, NH₃, and H₂O, and NH₄Cl: NaOH is a stronger base than NH₃. Water is a weaker acid than NH₄Cl. Weaker bases have stronger conjugate acids. NH₃ is a weak base, but its conjugate acid, NH₄Cl, is a strong acid.

Hydrogen carbonate ion, HCO₃⁻, is derived from a diprotic acid and is amphiprotic. Its conjugate acid is H₂CO₃, and its conjugate base is CO₃²⁻. The use of conjugate acid-base pairs allows us to make a very simple statement about relative strengths of acids and bases.

HOCN and OCN⁻ are an example of a conjugate acid-base pair. The only difference between the two is a proton (H⁺). All acids have a conjugate base and all bases have a conjugate acid. From the list of molecule/ion pairs below, click on those that are conjugate acid-base pairs.

Conjugate Acid-Base Pairs - Department of Chemistry

A conjugate pair is an acid-base pair that differs by one proton in their formulas (remember: proton, hydrogen ion, etc.). A conjugate pair is always one acid and one base. ALWAYS! (OK, you don't have to shout.) HCl + H₂O ==> H₃O⁺ + Cl⁻ Here is the one conjugate pair from the first example reaction: HCl and Cl⁻

ChemTeam: Conjugate pairs

The conjugate acid-base pairs for this reaction are NH₄⁺ / NH₃ and H₂O / OH⁻. Some common conjugate acid-base pairs are shown in Figure 7.7. 1. The strongest acids are at the bottom left, and the strongest bases are at the top right.

One of the more useful aspects of the Brønsted-Lowry definition of acids and bases in helping us deal with the pH of solutions is the concept of the conjugate acid-base pair. We argued qualitatively in the section on conjugate acid-base pairs in aqueous reactions that the strength of an acid and its conjugate base are inversely related. The stronger one is, the weaker the other will be. This relationship can be expressed quantitatively in terms of a very simple mathematical equation ...

Acids and bases exist as conjugate acid-base pairs. The term conjugate comes from the Latin stems meaning "joined together" and refers to things that are joined, particularly in pairs, such as Brønsted acids and bases. Every time a Brønsted acid acts as an H⁺ donor, it forms a conjugate base. Imagine a generic acid, HA.

The substance that is produced after an acid has donated its proton is called the conjugate base while the substance formed when a base accepts a proton is called the conjugate acid. The conjugate acid can donate a proton to the conjugate base, to reform the original reactants in the reverse reaction. HF + H₂O -> + H
