A novel powder processing method for the fabrication of thin open-celled porous siliconized silicon carbide ceramic substrates has been reported [316]. A green SiC-carbon substrate is first formed via a gelcasting method, using an organic-solvent-based slurry comprised of submicron SiC and nanometer carbon powders, along with a flexible and thermosetting polyurethane resin, based on the replica method with polyurethane foam as a template. Subsequently, the flexible semi-wet green substrate ...
