Ultrasonic Instruments and Devices examines how years of ultrasound research has led to many practical inventions that are now products of use to ordinary people. Examples of personalized applications include the ultrasonograms of an unborn child, the testing of the parts of an automobile for durability, the electronics which make a cell phone work, and the meter in the gas line leading to a house. Larger concerns, such as safety of aircraft, are also discussed. A chapter is devoted to each ...

Ultrasonic scaling instruments oscillate (move forward and backward) a typically blunt metal tip at a high-frequency producing mechanical vibratory, cavitation and acoustic microstreaming forces that remove/disrupt the deposits. (Walmsley et al., 1984; Khambay and Walmsley, 1999). Sound is a form of energy produced by vibrations.

The ultrasonic humidifier, one type of nebulizer (a device that creates a very fine spray), is a popular type of humidifier. It works by vibrating a metal plate at ultrasonic frequencies to nebulize (sometimes incorrectly called "atomize") the water. Because the water is not heated for evaporation, it produces a cool mist. The ultrasonic pressure waves nebulize not only the water but also materials in the water including calcium, other minerals, viruses, fungi, bacteria,

In ultrasonic dental devices with a piezoelectric transducer, an alternating electrical current is applied across a ceramic or quartz disk (Figure 3.9). In response to the alternating application of current, the crystalline structure alternately expands then contracts, producing vibrations that result in high-frequency oscillation of the tip (Laird and Walmsley, 1991) (Figure 3.10).
